Genes with similarity to proteins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein'. The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/crail-1.3/), GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html), NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and SplicePredictor (Volker Brendel, Stanford University, http://gremlini.zool.iastate.edu/cgl-bin/sp.cgl). Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Washington University School of Medicine, St. Louis, http://genome.wustl-edu/eddy/tRNAscan-SE/). This sequence may not be the entire insert of this clone. It may be shorter because we remove overlaps between neighboring submissions. The 5' clone is MLN21 and the 3' clone is MIE1. Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity. That are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Direct Submission Submitted (19-JAN-2001) The Institute for Genomic Research, 9 Submitted (19-JAN-2001) The Institute for Genomic Research, 9 Medical Center Dr. Rockville, MD 20850, USA, cdtown@tigr.org On Jan 19, 2001 this sequence version replaced gi:12280878. The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key corle in endogenous abscisic acid (ABA) biosynthesis under drought stress. Reoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by comethods for increasing or decreasing stress tolerance in a plant by comethods for increasing or decreasing stress tolerance in a plant by comeoxanthin cleavage enzyme is introduced. The improvement of stress coneoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and contained the removing the weed by specifically lowering stress tolerance in the weed by inducing an inducible promoter. The present cDNA sequence encodes arabidopsis thaliana neoxanthin cleavage enzyme, AtNCED3 protein.

The AtNCED3 cDNA is obtained from an Arabidopsis plant-derived cDNA companies in the companies of the CPRD65 (CowPea Responsive to Dehydration) gene isolated from cowpea plant as a probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match 100.0%;

             The invention relates to neoxanthin cleavage enzymes and their corresponding cDNA molecules. Neoxanthin cleavage enzyme plays a key role in endogenous abscisic acid (ABA) biosynthesis under drought stress. Neoxanthin cleavage enzyme is used for improving stress tolerance in a plant when expressed in a plant cell. The invention also relates to methods for increasing or decreasing stress tolerance in a plant by introducing the DNA into the plant, and a transgenic plant into which a neoxanthin cleavage enzyme is introduced. The improvement of stress tolerance in plants is useful, for example in plant breeding. Neoxanthin cleavage enzyme genes are useful for producing transgenic plants. An arid land can be improved by growing transformant weed for several years and then removing the weed by growing transformant weed for several years and then removing an inducible promoter. The present cDNA sequence encodes by copersicon esculentum neoxanthin cleavage enzyme, LeNCED1 protein
